

Real-Time NAPL Delineation Tools: A Comparison of Laser-Induced Fluorescence and Optical Profilers

Steve Aufdenkampe, Norfolk Southern

Barry J. Harding, AECOM

AECOM

Overview of Technologies

- Real-time vertical profiling tools.
- Probe attached to a direct-push platform.
- Nonaqueous phase liquid (NAPL) detection predicated upon ultraviolet fluorescence of polynuclear aromatic hydrocarbons present in NAPL.
- The basic components were described in 1992 patent.
- Two primary platforms now.

Platform Comparisons

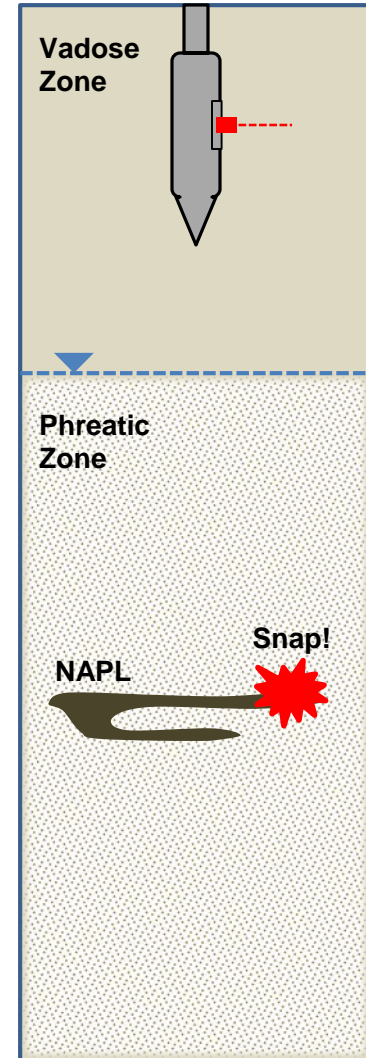

Ultra-violet Screening Tool and Optical Image Profiler

System Components	Laser-Induced Fluorescence	Optical Image Profiler
Platform	UVOST®	Geoprobe Systems® OIP
Heritage	LIF-ROST®	No Direct Ancestor
Deployment	Usually Direct-Push	Usually Direct-Push 1.75 SL
UV Source	308nm Laser via Fibre Optic	265nm ±10nm LED
Fluorescence Capture	Oscilloscope via Fibre Optic	CMOS Imaging Camera
Log Generation	Spectrally-Separated Data (4-channels) Converted to Voltages	Measurement of Pixel Area Exhibiting Fluorescence
Waveform Differentiation	Yes	No
Data Outputs	lif.data	640 x 480 px.jpg, .zip
File Size 30' Deep Profile	<20KB	Approximately 300MB
Options	TarGOST®, EC, HPT	Green LED, EC, HPT
Calibration	Use of Reference Emitter	Color Standards
Software Platform	OST Viewer	MIP Viewer
Costs (Michigan)	\$3700 / 10 Hour Day	\$3700 / 10 Hour Day

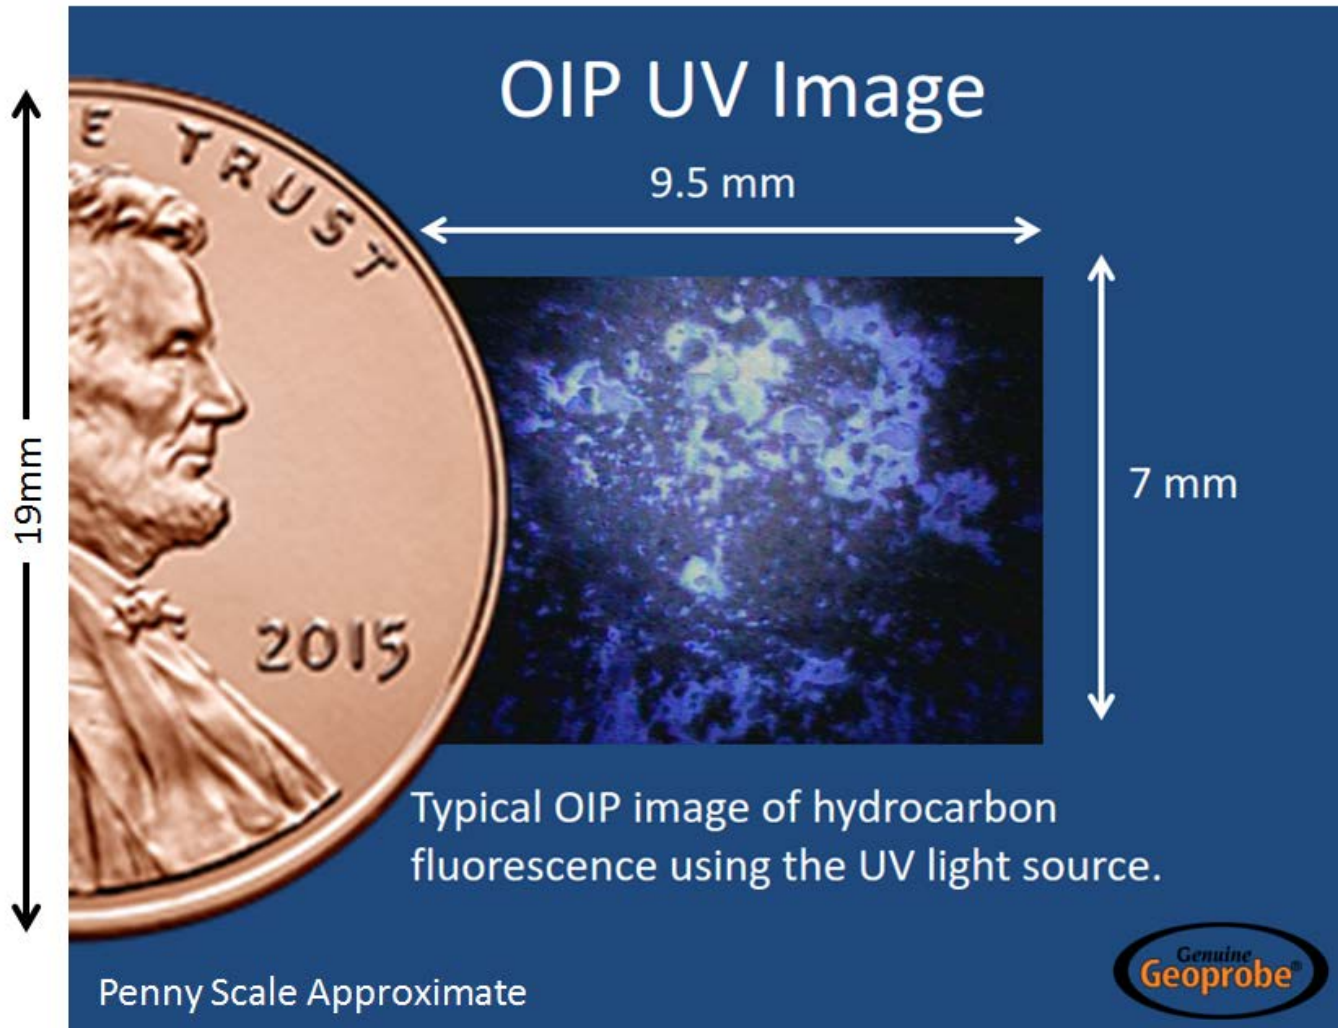

Optical Imaging Probe

OIP Description

- **Purpose:** Detecting UV induced fluorescence of non aqueous phase fuel hydrocarbons in soil.
- **Method:** High intensity UV light directed at the soil causes hydrocarbons present in the soil to fluoresce. An Image of the soil is captured by the camera and analyzed for fluorescence.
- Visible light images of the soil may also be obtained.

Millimeter-Scale Imaging

OIP UV Image

9.5 mm

19mm

7 mm

Typical OIP image of hydrocarbon fluorescence using the UV light source.

Penny Scale Approximate

Genuine Geoprobe®

The diagram illustrates the scale of millimeter-scale imaging. On the left, a portion of a 2015 US penny is shown for scale, with a vertical double-headed arrow indicating a height of 19mm. The words 'E TRUST' and the year '2015' are visible on the coin. To the right of the coin is a square OIP UV image showing hydrocarbon fluorescence. A horizontal double-headed arrow above the image indicates a width of 9.5 mm, and a vertical double-headed arrow to its right indicates a height of 7 mm. Below the image is the text 'Typical OIP image of hydrocarbon fluorescence using the UV light source.' and the 'Genuine Geoprobe' logo.

Which Platform to Choose?

LIF-UVOST®

- Co-mingled or mixed NAPL footprints
- When waveform diagnostics are needed
 - Weathering
 - Forensic Type Investigations
- Some field durability issues due to fiber optics and laser components
- Established system

OIP

- Obvious NAPL footprints (e.g. Diesel spills)
- Screening and targeting where NAPL is present
- Straight platform has less to go wrong
- Big data files due to images
- New platform being improved
- Gaining regulatory acceptance

Final Thoughts

- Both LIF and OIP are reliable field-screening tools for NAPL.
- Comparative costs.
- LIF offers more bang-for-the-buck due to waveform diagnostic and is a long-standing proven technology.
- OIP works as described for Diesel fuel, kerosene and gasoline, and probably other refined fuels.
- Be cautious of false positives for both platforms but more so with OIP. LIF waveform analysis allows ID of false-positives.
- Off-set and collect litho-stratigraphic data for either platform.
- OIP: Understand scale. Images depict grains and laminae not beds. Think Lincoln's nose on a penny. Millimeter-Scale.
